ZOOLOGICAL SCIENCE is published by the Zoological Society of Japan and devoted to publication of original articles, reviews, essays and short communications in the broad field of zoology. The journal was founded in 1984 as a result of the consolidation of Zoological Magazine (1888-1983) and Annotationes Zoologicae Japonenses (1897-1983), the former official journals of the Zoological Society of Japan. Each annual volume of more than 1300 pages consists of twelve regular monthly issues. The full text of all recent issues of ZOOLOGICAL SCIENCE can be found on the Internet at http://zsj.jstage.jst.go.jp/ (vol.14~vol.24 No.3) and at http://www.bioone.org/ (vol. 22~).

Publication of ZOOLOGICAL SCIENCE has been supported in part by a Grant-in-Aid for Publication of Scientific Research Results from Japan Society for the Promotion of Science.

SUBMISSION OF MANUSCRIPT. Manuscripts offered for consideration should be sent to the Zoological Science Editorial Office in accordance with the INSTRUCTIONS TO AUTHORS at the back of the first issue of the journal. The latest version of the INSTRUCTIONS and the manuscript submission site can be found on the internet at http://mc.manuscriptcentral.com/zs

SUBSCRIPTIONS. ZOOLOGICAL SCIENCE is distributed free of charge to the members, both domestic and foreign, of the Zoological Society of Japan. To non-member subscribers within Japan, it is distributed by the Zoological Society of Japan. Subscription outside Japan should be ordered from the sole agent, Japan Publications Trading Co., Ltd. P.O. Box 5030 Tokyo International, Tokyo 100-3191, Japan (Fax: +81-3-3292-0410 Email: serials@jptco.co.jp). New subscriptions and renewals begin with the first issue of the current volume.

(Cover Picture) The sika deer, Cervus nippon, is widely distributed along the coast of East Asia and in Japan. This species has recently caused various negative impacts to forest ecosystems and agricultural fields due to rapid increases in size of local populations. In their study reported in this issue, Yoshio et al. used microsatellite markers to detect two genetically distinctive clusters in the sika deer population on the Boso Peninsula, Japan.
